A collection of disease information resources and questions answered by our Genetic and Rare Diseases Information Specialists for Dermatofibrosarcoma.

Dermatofibrosarcoma protuberans - Wikipedia

J Dtsch Dermatol Ges. May doi: /ddg [Epub ahead of print]. S1 guidelines for dermatofibrosarcoma protuberans (DFSP) - update

DFSP is a locally invasive, slow-growing tumor of the subcutaneous tissue that rarely metastasizes but recurs frequently after surgical excision.

It is sometimes described as having tentacles that can grow into Dermatofibrosarcoma Protuberans (DFSP) fat, muscle and even bone. Although the American Joint Committee on cancer has not set forth a system specific for staging of DFSP, it is often staged according to the American Musculoskeletal Tumor Society Staging System which is based upon tumor grade and compartmentalization. It appears to be histologically similar to DFSP and in rare instances can be found within the same tumor in conjunction with DFSP, resulting in a Dermatofibrosarcoma Protuberans (DFSP) lesion.

Histologically,DFSPisidentifiedbyapatternofmonomorphousproliferat gives it the power to kill cancer cells while preventing serious damage to non-cancerous cells.
